

VERION

The only company in the world. And the biggest.

Compete, collect and forecast — on what you know about anime.

Quiz esports × digital IP cards × an anime-native prediction market.

The first economy where a fan's love — their knowledge — finally pays.

1,454 original animation cels held / International patent pending / Akira Morikawa, founding
CEO of LINE, as outside advisor

Anime is now a global common language.

In 2024 Japan's anime industry hit an all-time high — and more than half of it is already earned overseas. Fans are scattered worldwide not by country, but by title.

\$24B

Japan's anime industry (2024, record high)

\$13.6B

Overseas share (+26% YoY, now the majority)

\$60B

Projected global market, 2030 (different basis)

Source: Association of Japanese Animations, "Anime Industry Report 2025". Global projection from third-party research as reported. Converted at \$1 = ¥160.

Fans only ever paid in.

That \$24 billion is what fans paid in. However much they watch, however much they remember, what comes back is close to zero. The fans who know a work best get the least — and worldwide, this is the one space still left empty.

WATCH

Hundreds of hours, again and again.

KNOW

Every line. Every cut. Remembered.

NO RETURN

And still, nowhere for it to pay off.

THIS IS OUR MARKET

Prizes and rewards are funded by sponsors and IP-side marketing budgets, plus card sales and secondary-trade fees. This is not fans redistributing money among themselves.

Labour is leaving human hands.

As AI takes on a body and robots take on production, what is left to people is free time. And free time has always gone the same way — to play, and to contest. For five thousand years, without a single exception.

What we operate is a sport won by knowledge rather than luck, and a market where opinion becomes a price (the market launches only after licensing).

PAST

5,000 years, never once collapsed

From knucklebones to Roman chariot races to the rice market at Dojima — the ancestor of the prediction market. Contests that people burn for are humanity's oldest industry.

NOW

Why 2026

Anime revenue tipped majority-overseas (2024). Prediction markets reached regulation and scale valuations (2025-26). AI drove the marginal cost of writing and translating questions to near zero. And embodied AI began taking on labour.

NEXT

The line between play and work disappears

What you leave behind while playing becomes value — financial entertainment.

Knowledge becomes an asset.

Quizzes gather the fans and the heat. Cards generate the revenue. The prediction market turns that heat into a price. Three parts, one economy.

ENTRY — PHASE 1

Quiz esports

A sport decided by knowledge alone, 24 hours a day. Not reflexes, not spending — depth of love sets the ranking.

REVENUE — PHASE 1

Digital IP cards

Cards are the only thing we sell. About \$20 each — the base tile plus eight completes the picture.

THE UPSIDE — PHASE 2

Anime prediction market

A market where you back a title's future with what you know. For the first time, fandom becomes a price.

24 hours a day, from anywhere on earth.

One question per screen. Bet points on a two-choice line and double them if you are right. Manga, footage and predictions move through the same feed — on mobile, you swipe through it vertically.

- Eight scoring dimensions of knowledge and strategy
- Leagues of ten, cycling through promotion and relegation
- AI writes questions across every IP, episode and language
- Points cannot be bought — they are earned by playing

* Screens are in-development mocks. Titles and images do not indicate any licence or partnership with the rights holders.

* Any randomised sale is offered with disclosed odds, age restrictions, and compliance with the regulations of each market.

The ads are quizzes.

Sponsor ads run as quizzes. Answering earns competition points — at launch, ads are the only source of points. So ads are not skipped; they are watched and understood.

- Answers earn free points (60 correct, 30 even when wrong) — ads become the free player's way in, and users start waiting for them.
- Answering requires understanding the ad — watched-and-considered ads perform in a different league from glanced banners.
- IP-attribute targeting — "which IP are you a fan of" — priced at a multiple of ordinary ads.

Tournament sponsorship money goes entirely to the prize pool — managed separately from ad revenue.

Prize money, and the real thing.

Tournaments open per IP, each with a live countdown to its deadline. Winners take prize money — and original animation cels that will never be made again.

— Entry paid in competition points (no cash wagering)

— Prizes funded by card sales and sponsors

— Top prizes include original cels and key art

* Screens are in-development mocks. Titles and images do not indicate any licence or partnership with the rights holders.

Nine cards. One picture.

The digital IP card is the only thing we charge for. The centre tile is yours from the start. Fill the eight slots around it and the picture is complete. Pull for the missing piece, or trade someone for it.

≈ \$20

Per card

≈ \$160

One set of eight completes the picture

P2P

Traded directly between users

People collect for more than the picture. A completed set opens tournament entry and physical animation cels.

Revenue comes from three places: card sales, secondary-trade fees, and prediction-market fees. Nothing else is monetised.

We do not fight the generalists.

Prediction markets are where global finance is looking hardest right now. Politics and sports are already taken by giants. We hold what they can never acquire — anime knowledge, and the fans who have it.

≈ \$22B

Kalshi valuation (reported, Mar 2026)

≈ 5×

Combined monthly volume growth in 8 months

\$1–1.5T

Projected annual notional volume, 2030

Q Who will perform the next opening theme?

Q Will this title get a third season?

Q Which show will be most watched this season?

* The prediction market launches only after the relevant financial licences are obtained. Jurisdictions are assessed individually, and the market opens market by market as licences are granted.
Source: reported figures on Kalshi and Polymarket (2026); market size projections are analyst estimates from Bernstein and Macquarie. These are not our own forecasts.

Generalist (politics, sports, finance) → Anime & entertainment specialist

Our revenue here is the trading fee. The 2031 plan is built on quizzes and cards; the prediction market sits on top of it as upside.

The world's largest holder of animation cels.

Cels stopped being produced when the industry went digital. They will never be made again. We already hold 1,454 and are buying toward 200,000. The art behind our cards — and the prizes in our tournaments — comes from here.

... and 1,427 more. All physically held by the company.

1,454 **200,000** **DISCONTINUED**

Cels held today

Target holding

The supply can never grow again

* Our valuation of the 1,454 cels held today is ≈\$3.8M — premium-tier pieces averaging ≈\$2,600 each. Standard-tier pieces are expected at tens to hundreds of dollars; 200,000 is a long-term target built up from Series B onward.

* Owning a cel is not the same as owning its copyright. Digitisation and card production are carried out under contracts with the rights holders.

VERION

VERION Inc. / CONFIDENTIAL / All artwork rights remain with their respective holders

Only we can build with the database of what lands.

Dozens of companies will make anime with AI. But only the company running the playground knows which title, which scene, which cut the world actually reacted to.

What the streamers hold is "what people finished watching". What we hold is "which scene they committed points to" — the intensity of love, recorded as a number.

This data is valuable to the rights holders too — which scene, which fans, anywhere in the world. It is material for IP negotiations, and the seed of future licensing revenue.

Illustrative — ≈700 million scene-level reactions a year at 100,000 MAU (Series A), ≈10 billion at 1.5M MAU (2031 plan).

* Step 04 is automated quiz generation for now (AI-produced anime is a later phase).

They can copy us. They cannot catch up.

On top of the physical cels we already hold, three moats: the IP we secured first, international patents, and data that compounds the more the platform is played.

00	1,454 original cels (held)	Money cannot buy these later
01	Exclusive IP licences (securing)	Not on these titles
02	International patents (pending)	Not with this mechanism
03	Fandom data (accumulating)	Not at this precision

The incumbents work single-IP, single-country, physical distribution. We work across every IP, in every language, digitally — not competing with rights holders, but making their works worth more.

A small, senior team.

Advertising, IP, web3, platforms — the experience this business needs is already in the room. **Akira Morikawa, who led LINE as it became Japan's national platform, serves as our outside advisor.**

Daisuke Yamashita

CEO / Founder

Started his first company at 16. Founded an app studio in 2015 and sold it in 2020.
Founded VERION in 2025.

Teppei Wakayanagi

Business Development & Legal

Dentsu from 1997; built the forerunner of radiko. Launched an NFT marketplace as executive officer at Kosaido HD; web3 at DMM.

Kouji Asai

Strategy & Marketing

Dentsu from 2010. Spotify's Japan launch, CHANEL, Monster Strike, Granblue Fantasy. Now executive officer at Sunday Morning.

Akira Morikawa

Outside Advisor

Former President & CEO of LINE Corporation; founder of C Channel. Led LINE as it became Japan's national platform.

Engineering — the prototype runs on in-house development. Hiring engineers is one of the principal uses of this round.
Where we are — Prototype running. 1,454 cels acquired. IP negotiations under way in parallel.

Public in 2031.

Starting with anime, extending into drama, film and sport. 1.5M monthly users by 2031; 200 IPs and 100M users in the decade beyond.

The 2031 build-up: $1.5\text{M MAU} \times 10\% \text{ paying} \times 2.8 \text{ cards/month} \times \approx \$20 \approx \$94\text{M}$ a year. Sponsorship, advertising and fees take it to $\approx \$125\text{M}$. The 100M MAU figure is the ten-year goal. At a 5% paying rate (the upper end of the industry average) that is $\approx \$47\text{M}$ a year; at 3%, $\approx \$28\text{M}$. The 10% case assumes core fans under exclusive IP. Acquisition runs mainly through IP $\times$ influencer campaigns, VTuber live streams, social advertising and app-store optimisation.

The only one in the world. And the biggest.

An industry that has not collapsed once in five thousand years — rebuilt, this time on anime.

| We are currently raising our seed round. A 30-minute call is available.
